

Mindloom typed engine: inference path from surface evidence to typed output

engine layer

illustrative trace (constructed line, not an engine output): "I know what I sent. If you trusted me, you would stop questioning this."

L1 evidence atoms

surface items recorded with their span: named feeling, question form, absolute expression, explicit return time ...

"I know what I sent": assertion.
"Stop questioning": imperative against inquiry.
"If you trusted me": condition placed on the addressee.

L2 evidence features

atoms aggregated into features: minimal response, required response, reply constraint, closure ...

Reply constraint: present. Request for the other to regulate: absent.
Closure of the topic: absent.

L3 bridges

label-specific evidence requirements checked; a required item missing in L1 blocks the label

LOCK bridge (reply constraint in L1): met. SEAL bridge (closure): not met. DRAIN bridge (other as regulator): not met.

L4 configuration

at most one of eight configurations; SEAL (function) may co-occur; SHIFT (event) needs before/after evidence

Configuration = LOCK; SEAL not assigned; SHIFT: no before/after configuration evidence.

L5 typed output

label with evidence trail (L1 spans → L2 → L3), or abstention "insufficient context"

LOCK with trail to the L1 spans; the engine would abstain if L3 had found no supporting atom.
